Assignment 5: Advanced JavaScript and DOM Manipulation

Project: WanderWay — Travel Website

Team members: Yelubek Bakdaulet and Ismail Bolat
Group: Add your group number before submission
Deployment URL: Not deployed yet — add the GitHub Pages or Netlify URL after deployment.

Objective

The objective was to continue the WanderWay travel website and add interactive behavior using JavaScript, DOM manipulation, event handling, animations and sound while keeping HTML, CSS and JavaScript separate.

1. DOM Manipulation and Styling

The script selects elements with getElementById and querySelectorAll. Text is updated with textContent, classes are toggled for theme and background changes, and FAQ answers expand or collapse when clicked.

The Day/Night button changes the body class and updates its label and aria-pressed attribute.

2. Event Handling

Buttons use addEventListener for clicks. The subscription popup opens and closes with buttons, outside click, or Escape. The current date and time are refreshed every second.

The navigation menu supports ArrowLeft/ArrowRight and ArrowUp/ArrowDown to move focus between links. A switch statement selects the requested travel category.

3. JavaScript Advanced Concepts

Destination suggestions are stored as an array of objects. filter() and forEach() process the collection; functions keep repeated behavior organized.

The travel chime is generated using the Web Audio API after a user click. Suggestion changes trigger a CSS animation.

4. Structure and Code Quality

The project keeps page structure in HTML, appearance in css/style.css and behavior in js/script.js. The code uses descriptive names, reusable functions and comments.

The existing contact form validation is retained. It validates inputs locally and clearly explains that the demo does not send data to a server.

5. Creativity and User Experience

The new Quick Destination Finder offers Nature, Culture and City categories plus a Surprise Me action. The interface includes a day/night theme, a sound button, accessible live messages and keyboard support.

How to test the website

Extract the ZIP and open Travel_Assignment_4/index.html in a modern browser. Test each destination category and Surprise Me; toggle Day/Night Mode; play the chime; change the background color; open FAQ items; open and close Subscribe; and test the contact form validation.

For the deployment requirement, push the project to the team repository and deploy with GitHub Pages or Netlify. Replace the deployment URL above with the real URL.

Final Reflection

The assignment extends the original travel website with interactive elements and demonstrates DOM updates, events, arrays, objects, higher-order functions, a switch statement, keyboard navigation, sound and animation. Before final submission, add screenshots of the running pages and code, enter the group number, and insert the deployed website URL.

Screenshot checklist for final submission

- Screenshot of the Home page and Quick Destination Finder.
- Screenshot showing the Night Mode and destination suggestion interaction.
- Screenshot of the JavaScript code (js/script.js) showing event listeners, switch, arrays and sound.
- Screenshot of the deployed website in a browser.
